<i>Preface</i>	xv
1 Strain	1
1.1 The continuum approximation	1
1.2 What is deformation?	2
1.3 The displacement vector and the strain tensor	3
1.3.1 Normal strain and shear strain	5
1.4 Closing remarks	6
1.5 Problem set 1	7
2 Stress	9
2.1 What is stress?	9
2.2 Cauchy's stress tensor in a continuum	10
2.3 Normal stresses and shear stresses	13
2.4 Stress at the atomic scale	13
2.5 Invariants of the stress tensor	15
2.6 Shear stress on a plane and the von Mises stress invariant	17
2.7 Mechanical equilibrium	19
2.8 Adiabatic and isothermal stress	21
2.9 Problem set 2	25
3 Hooke's law and elastic constants	29
3.1 Generalised Hooke's law: elastic constants and compliances	29
3.2 The maximum number of independent elastic constants in a crystal	30
3.2.1 The elastic energy density	30
3.2.2 Matrix notation	31
3.3 Transformation of the elastic constant tensor under a rotation	33
3.3.1 Neumann's principle	33
3.4 Isotropic materials	34
3.5 Anisotropic materials	38
3.5.1 Cubic crystals	38
3.5.2 The directional dependence of the elastic constants in anisotropic media	39
3.6 Further restrictions on the elastic constants	41
3.7 Elastic constants and atomic interactions	41

3.8	Isothermal and adiabatic elastic moduli	43
3.9	Problem set 3	46
4	The Green's function in linear elasticity	55
4.1	Differential equation for the displacement field	55
4.1.1	Navier's equation	56
4.2	The physical meaning of the elastic Green's function	57
4.2.1	Definition of the Green's function in linear elasticity	57
4.2.2	The equation for the Green's function in an infinite medium	59
4.2.3	Solving elastic boundary value problems with the Green's function	60
4.3	A general formula for the Green's function in anisotropic elastic media	64
4.4	The Green's function in an isotropic elastic medium	67
4.5	The multipole expansion	68
4.6	Relation between the Green's functions for an elastic continuum and a crystal lattice	70
4.7	Eshelby's ellipsoidal inclusion	73
4.8	The equation of motion and elastic waves	81
4.8.1	Elastic waves	82
4.9	The elastodynamic Green's function	84
4.10	Problem set 4	85
5	Point defects	93
5.1	Introduction	93
5.2	The misfitting sphere model of a point defect	94
5.3	Interaction energies	98
5.4	The λ -tensor	101
5.5	Problem set 5	102
6	Dislocations	105
6.1	Introduction	105
6.2	Dislocations as the agents of plastic deformation	106
6.3	Characterisation of dislocations: the Burgers circuit	108
6.4	Glide, climb and cross-slip	112
6.5	The interaction energy between a dislocation and another source of stress	113
6.6	The Peach–Koehler force on a dislocation	116
6.7	Volterra's formula	118
6.8	The infinitesimal loop	119
6.9	The dipole tensor of an infinitesimal loop	120
6.10	The infinitesimal loop in isotropic elasticity	123

6.11	Mura's formula	124
6.12	The stress field of an edge dislocation in isotropic elasticity	126
6.13	The elastic energy of a dislocation	128
6.14	The Frank–Read source	130
6.15	Problem set 6	134
7	Hybrid models of dislocations	141
<hr/>		
7.1	Introduction	141
7.2	Frenkel–Kontorova model	142
7.3	Peierls–Nabarro model	146
7.3.1	Comments on the Peierls–Nabarro model	151
7.4	Stacking faults and partial dislocations	153
7.5	The static friction stress on a dislocation	154
7.6	Dislocation motion by a kink mechanism	157
7.7	Problem set 7	159
8	The force on a defect	163
<hr/>		
8.1	Introduction	163
8.2	The electrostatic force on a charge	164
8.3	The pressure on an interface	165
8.4	The force on a static defect	167
8.5	Relationship to the static energy-momentum tensor	170
8.6	The force due to an applied stress and image forces	172
8.7	The Peach–Koehler force revisited	174
8.8	Problem set 8	176
9	Cracks	179
<hr/>		
9.1	Introduction	179
9.2	Mathematical preliminaries	180
9.2.1	Chebyshev polynomials	180
9.2.2	Solution of the Cauchy type integral equation	182
9.2.3	Some contour integrals	185
9.3	Representation of loaded cracks as distributions of dislocations	188
9.4	Elastic field of a mode I slit crack and the stress intensity factor	190
9.5	Energy considerations and Griffith's fracture criterion	193
9.6	The interaction between a dislocation and a slit crack	197
9.6.1	Shielding and anti-shielding of cracks by dislocations	199
9.7	Dugdale–Bilby–Cottrell–Swinden (DBCS) model	202
9.8	The dislocation free zone model	206
9.9	The influence of interatomic forces on slit cracks	212
9.10	Problem set 9	214

10 Open questions	221
10.1 Introduction	221
10.2 Work hardening	221
10.2.1 The nature of the problem	221
10.2.2 Work hardening of fcc single crystals	222
10.2.3 The Cottrell–Stokes law	223
10.2.4 Work hardening and self-organised criticality	225
10.2.5 Slip lines and slip bands	226
10.2.6 Slip bands as the agents of plastic deformation	227
10.3 Electroplasticity	232
10.3.1 Introduction and experimental observations	232
10.3.2 Possible mechanisms	233
10.3.3 Recommendations for further research	237
10.4 The mobility of dislocations in pure single crystals	237
10.4.1 Static vs. dynamic friction	238
10.4.2 Drag forces due to the phonon wind and fluttering mechanisms	239
10.4.3 Drag forces due to electronic excitations	239
10.4.4 Radiation of atomic vibrations from a moving dislocation	240
10.5 Hydrogen-assisted cracking in metals	242
10.5.1 Introduction	242
10.5.2 Possible mechanisms	243
10.5.3 Theory of hydrogen in metals	246
10.5.4 Suggestions for further research	247
